choice

**technical feasibility**

**environment & landscape**

**urban planning**

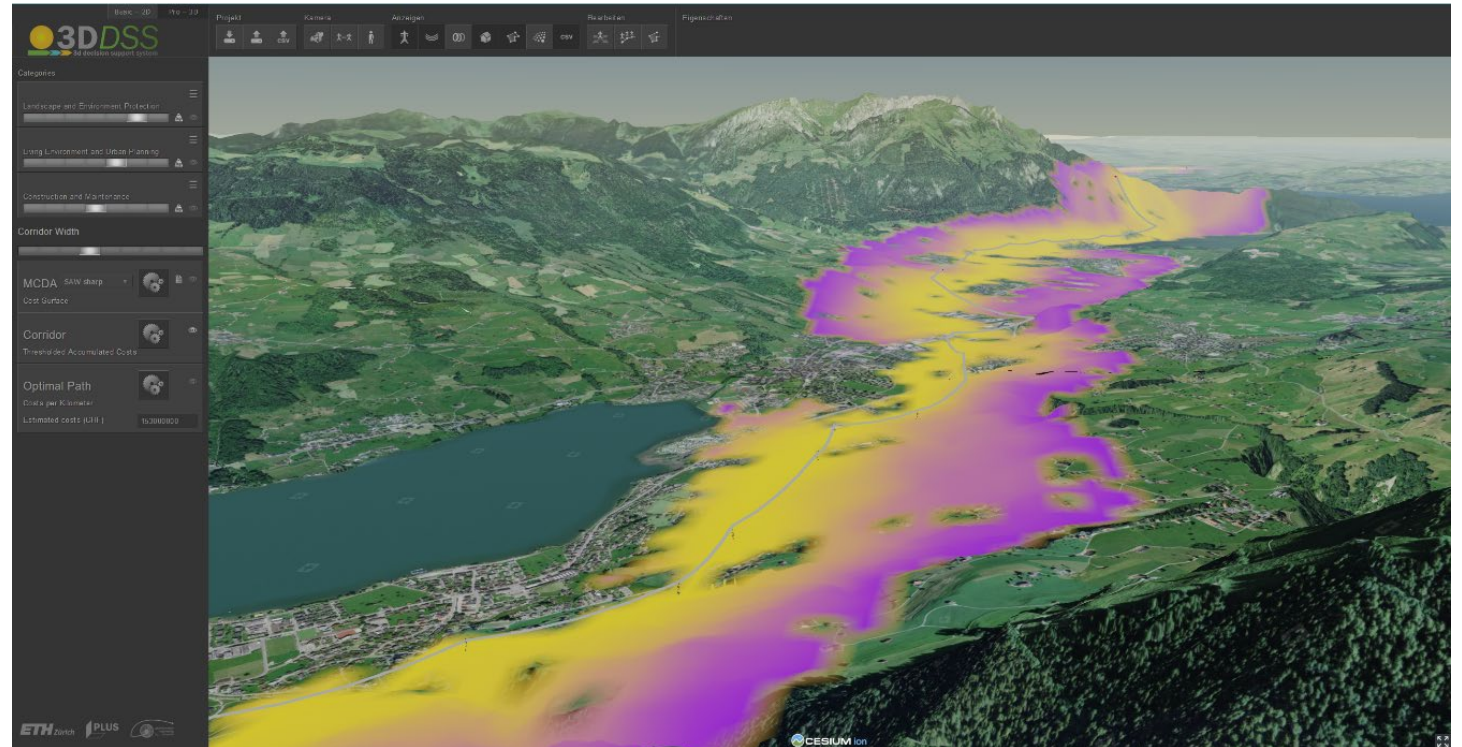

# Multi-Criteria Decision Analysis

# Content

1. New power transmission lines: a controversial topic
2. The 3D DSS project
3. How our 3D DSS works
4. Recent findings
5. Next steps

# New power transmission lines: a controversial topic

# We need electricity for our daily life

# Trends in grid expansion due to growth and the energy transition

## New large power plants

## International association

## Supply of downstream grids

# Delays in grid expansion projects

Why?

# Affected citizens can object against a new transmission line

bergheinfeld-sagt-nein.de (2017)

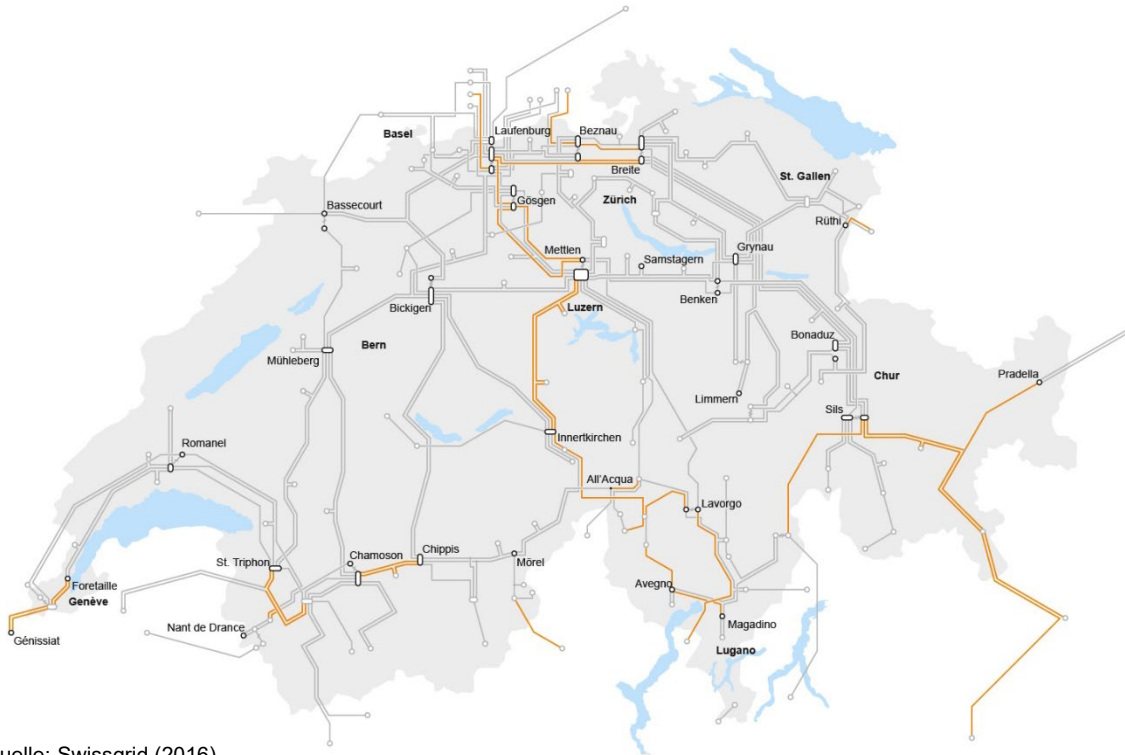

# Communicating with affected citizens can help to increase acceptance

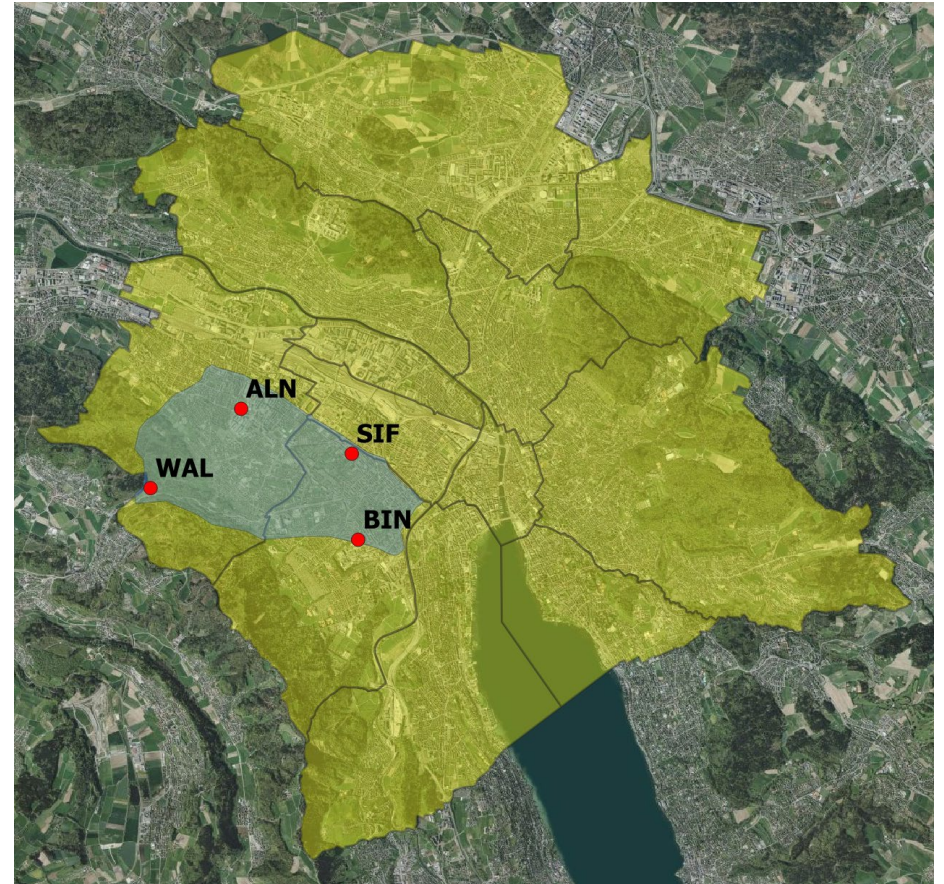

# Our study areas: electricity bottlenecks in central Switzerland and Zurich

Quelle: Swissgrid (2016)

Main questions : How can...

we achieve realistic  
modeling?

Main questions : How can...  
overhead lines be combined with  
earth cables?

# The 3D DSS project

DSS = Decision  
Support System

# The 3D DSS project

# How our 3D Decision Support System (3D DSS) works

MCDAA  $\infty$  LCP

Multi-Criteria  
Decision Analysis

Least  
Cost Path

# Key Concept # 1

costs = laws, acts,  
protected areas

# Key Concept # 2

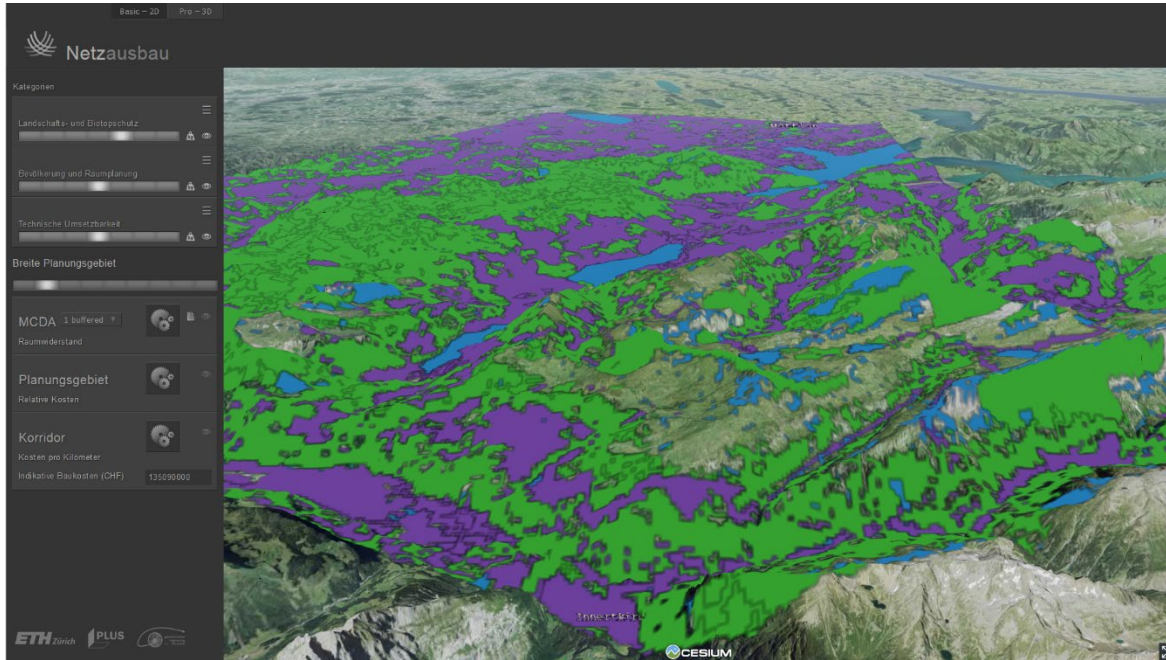

low costs =  
high suitability

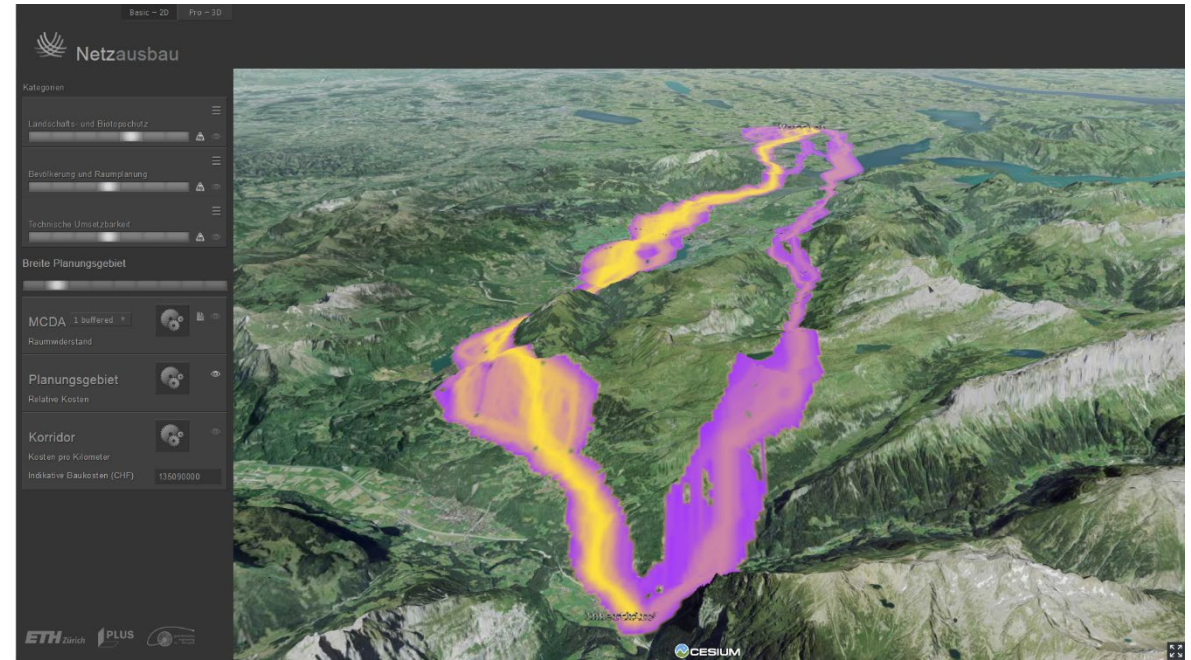

# How the most feasible corridor is calculated

geodata

corridor

## Current results and work

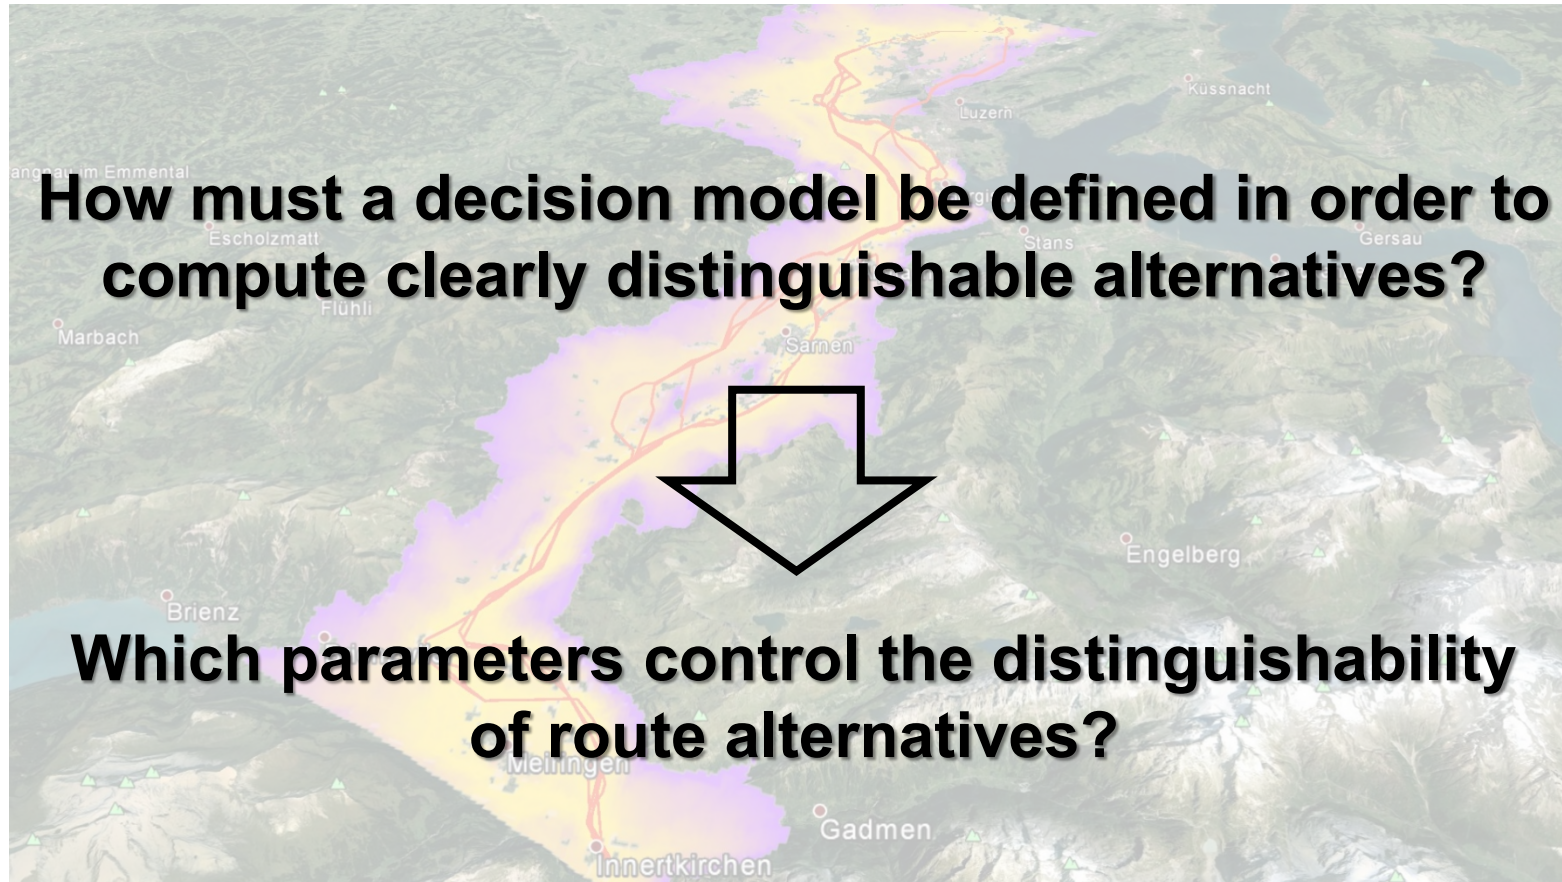

# The decision model

# Decision-makers want to decide between few route alternatives, not thousands or millions

# Which parameters matter most?

Concerns!!!

boundary model	★	★	★	★
MCDA method	★	★	★	
weighting model	★	★		
utility function	★			
interactions				

# Recent results we use for improving the decision model

- The continuous boundary model achieved best results and reflects real conditions best

# Recent results we use for improving the decision model

- The continuous boundary model achieved best results and reflects real conditions best
- Simple Additive Weighting (= Weighted Linear Combination) achieved best results and is easy to understand

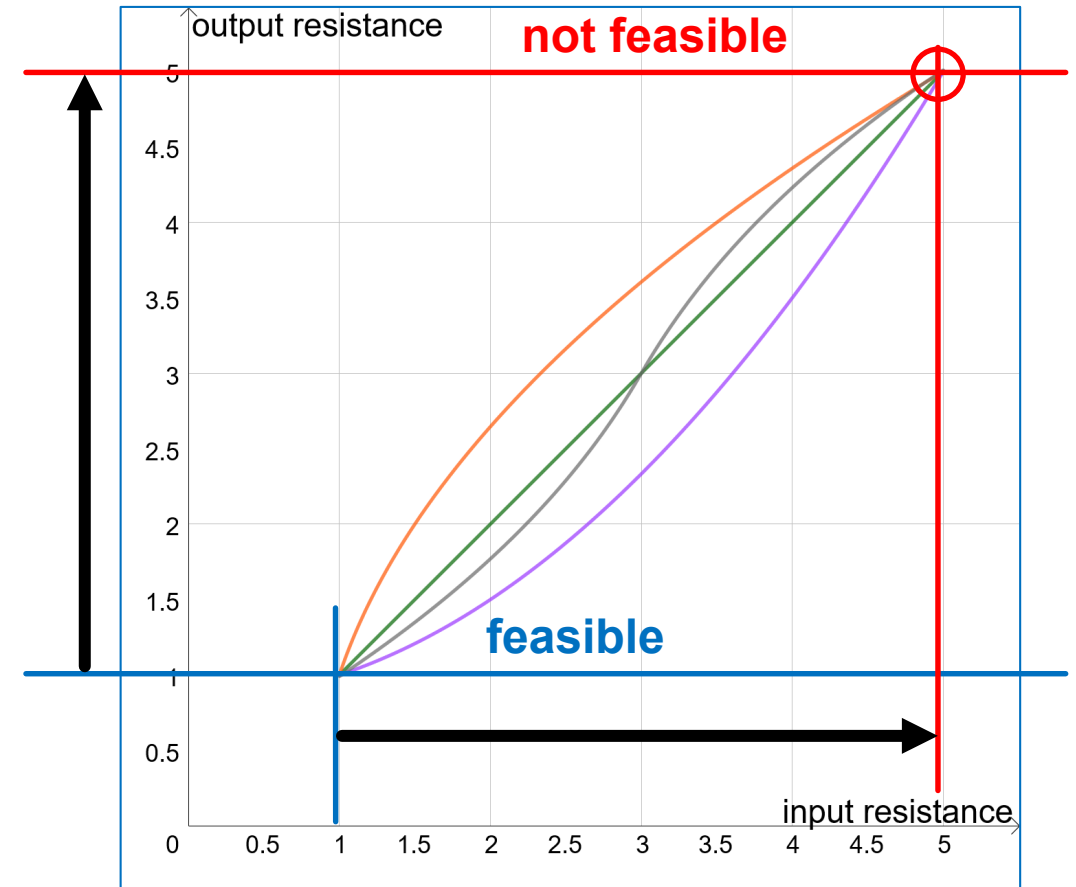

Simple Additive Weighting

# Recent results we use for improving the decision model

- The continuous boundary model achieved best results and reflects real conditions best
- Simple Additive Weighting achieved best results and is easy to understand
- The utility function with linear increase achieved best results (perhaps because users expect linearity)

Attributes

vs.

Objectives

# Our data model consists of georeferenced datasets (= criteria)

Categories	Criteria	Objectives
Environmental protection	Protection areas according to game laws	Preserve ecosystems: secondary
Environmental protection	National parks	Preserve landscape: primary
Environmental protection	UNESO World Heritage Site	Preserve landscape: primary
Environmental protection	Geotope	Preserve landscape: secondary
Construction and maintenance	Natural hazard areas	Meet strict legal requirements and minimize risks
Construction and maintenance	Groundwater areas S1 and watercourse corridors	Meet strict legal requirements and minimize risks
Construction and maintenance	Groundwater areas S2	Construct power line despite difficult circumstances and high costs
Construction and maintenance	South facing areas	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Inappropriate relief	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Inappropriate underground material	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Water bodies	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Proximity to wide streets	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Proximity to existing lines	Increase bundling
Construction and maintenance	Proximity to railways	Increase bundling
Urban planning	Infrastructure facilities	Avoid infrastructure facilities
Urban planning	Airports	Avoid infrastructure facilities
Urban planning	Arable land	Preserve landscape: secondary
Urban planning	Areas within noise threshold of 40 dBA	Preserve living space: primary

- Today 33 criteria grouped into 3 categories
- We are working on a new model with 50+ categories to redefine decision-making
- However, we observed that experts focused just on 5–10 criteria
- Nevertheless, experts want to have full control over each criterion and consider them on demand
- However, some criteria **must** be considered by law

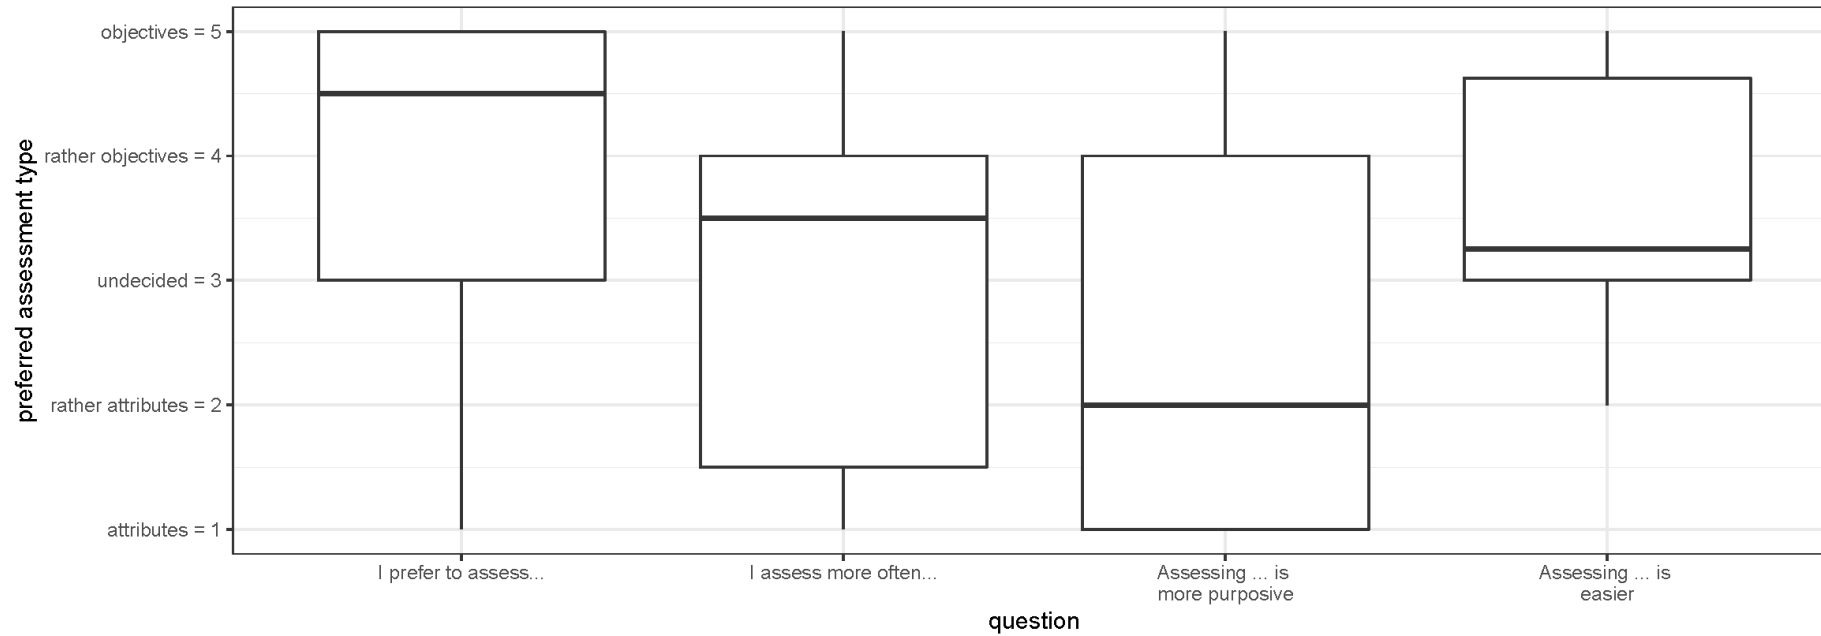

# Our data model consists of georeferenced datasets (= criteria)

## New focus

Categories	Criteria	Objectives
Environmental protection	Protection areas according to game laws	Preserve ecosystems: secondary
Environmental protection	National parks	Preserve landscape: primary
Environmental protection	UNESO World Heritage Site	Preserve landscape: primary
Environmental protection	Geotope	Preserve landscape: secondary
Construction and maintenance	Natural hazard areas	Meet strict legal requirements and minimize risks
Construction and maintenance	Groundwater areas S1 and watercourse corridors	Meet strict legal requirements and minimize risks
Construction and maintenance	Groundwater areas S2	Construct power line despite difficult circumstances and high costs
Construction and maintenance	South facing areas	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Inappropriate relief	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Inappropriate underground material	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Water bodies	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Proximity to wide streets	Construct power line despite difficult circumstances and high costs
Construction and maintenance	Proximity to existing lines	Increase bundling
Construction and maintenance	Proximity to railways	Increase bundling
Urban planning	Infrastructure facilities	Avoid infrastructure facilities
Urban planning	Airports	Avoid infrastructure facilities
Urban planning	Arable land	Preserve landscape: secondary
Urban planning	Areas within noise threshold of 40 dBA	Preserve living space: primary

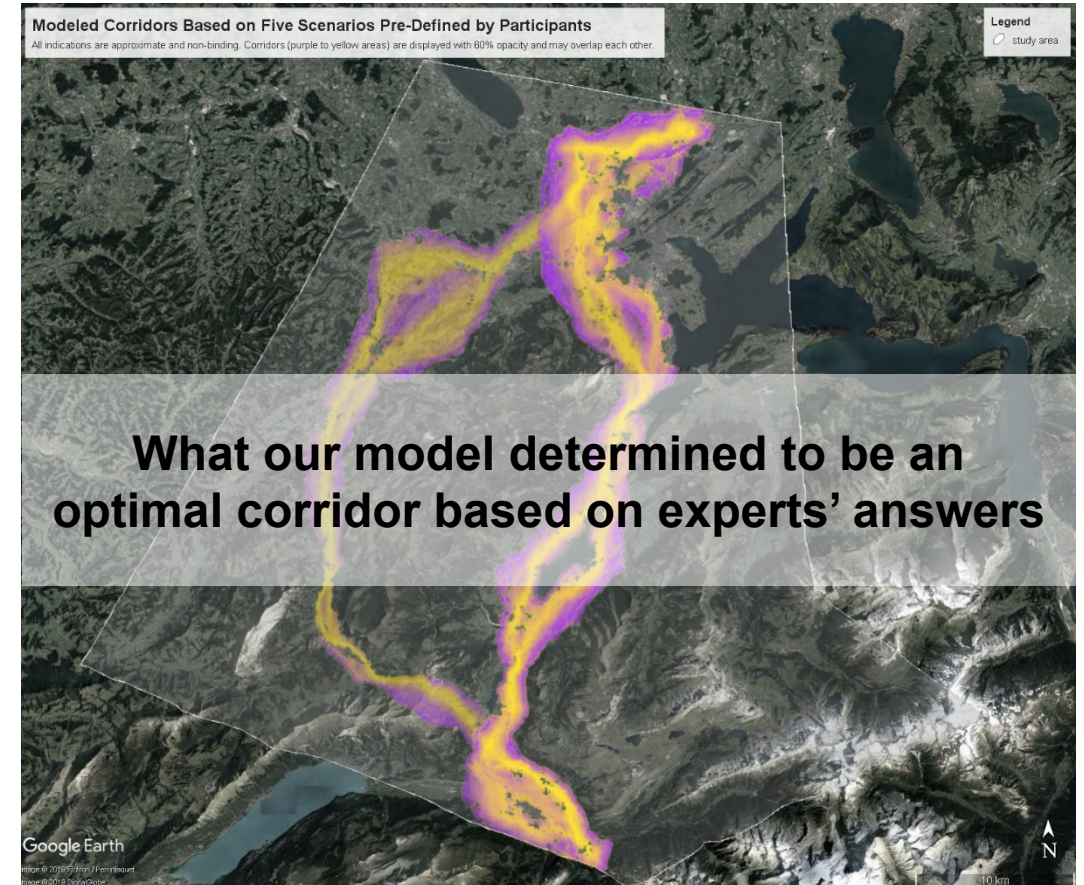

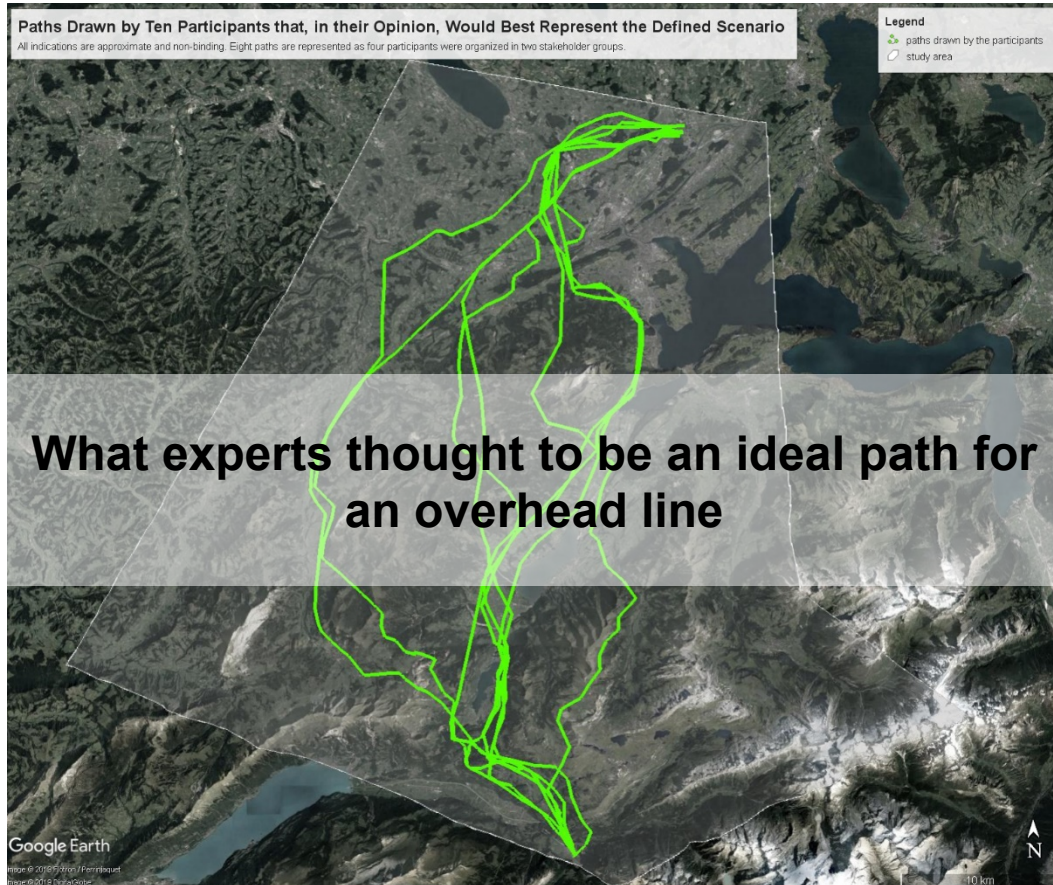

- Each factor is assigned a main objective.
- This main objective is fulfilled the more the corresponding areas are avoided.
- Alternatives can be compared based on the achievement of a specific objective.
- **We want to determine the most suitable alternative based on spatial (linear) optimization**

Differences of discussing and assessing attributes or objectives  
n = 10 participants

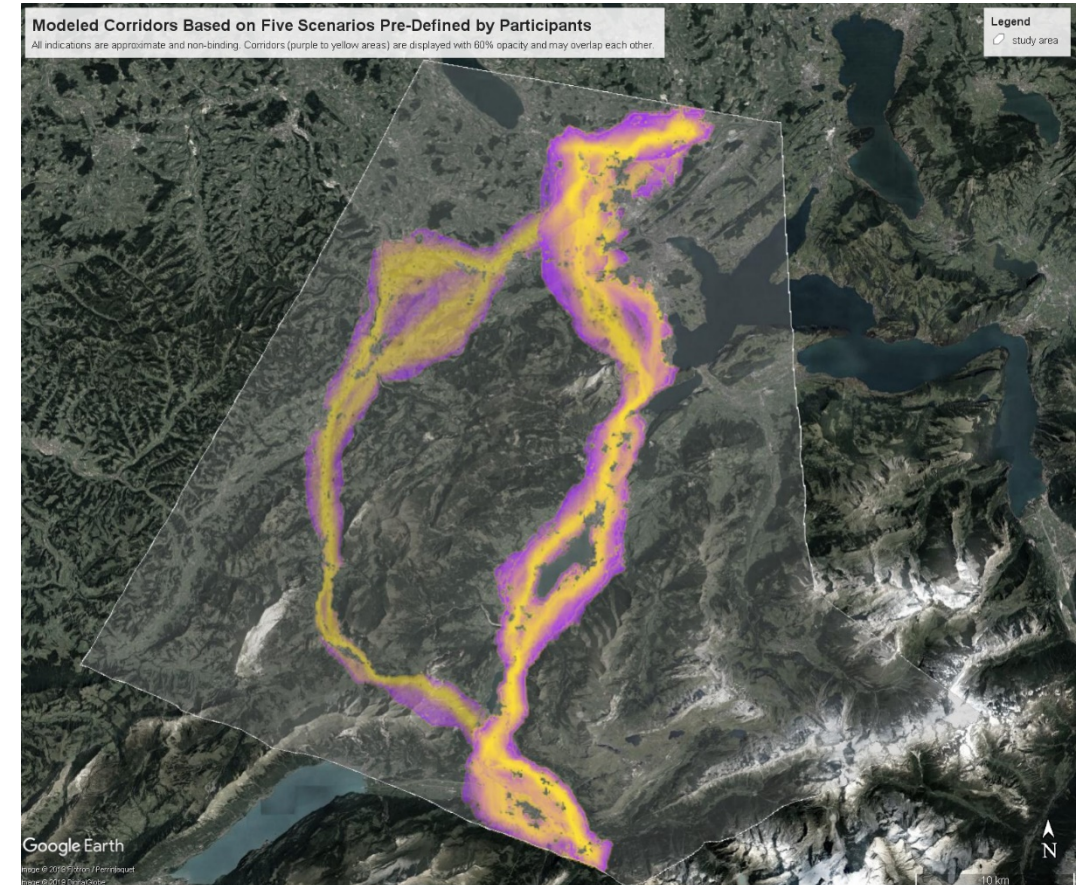

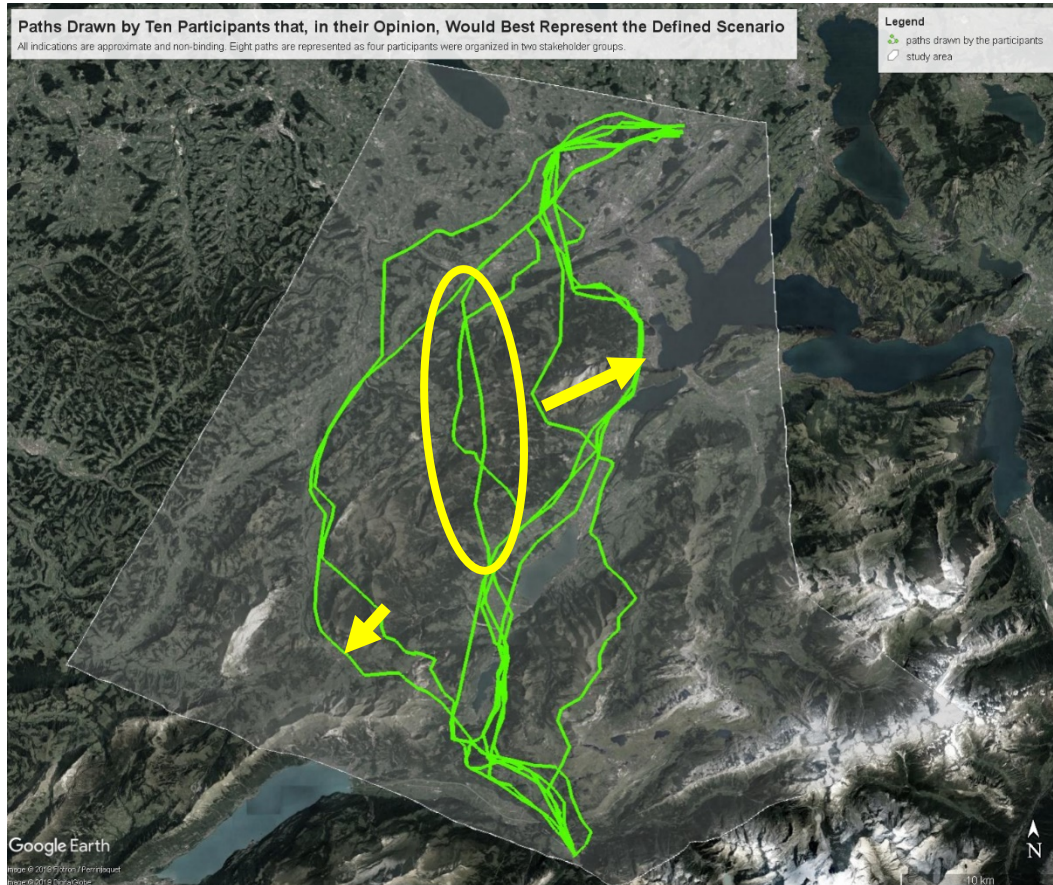

# Study conducted with 10 planning experts (2019)

# Study conducted with 10 planning experts (2019)

## Experts agreed reconsidering critical sections of proposed lines

# Study conducted with 10 planning experts (2019)

## Our 3D DSS fulfills experts' expectations well

# Study conducted with 10 planning experts (2019)

## Our 3D DSS fulfills experts' expectations well

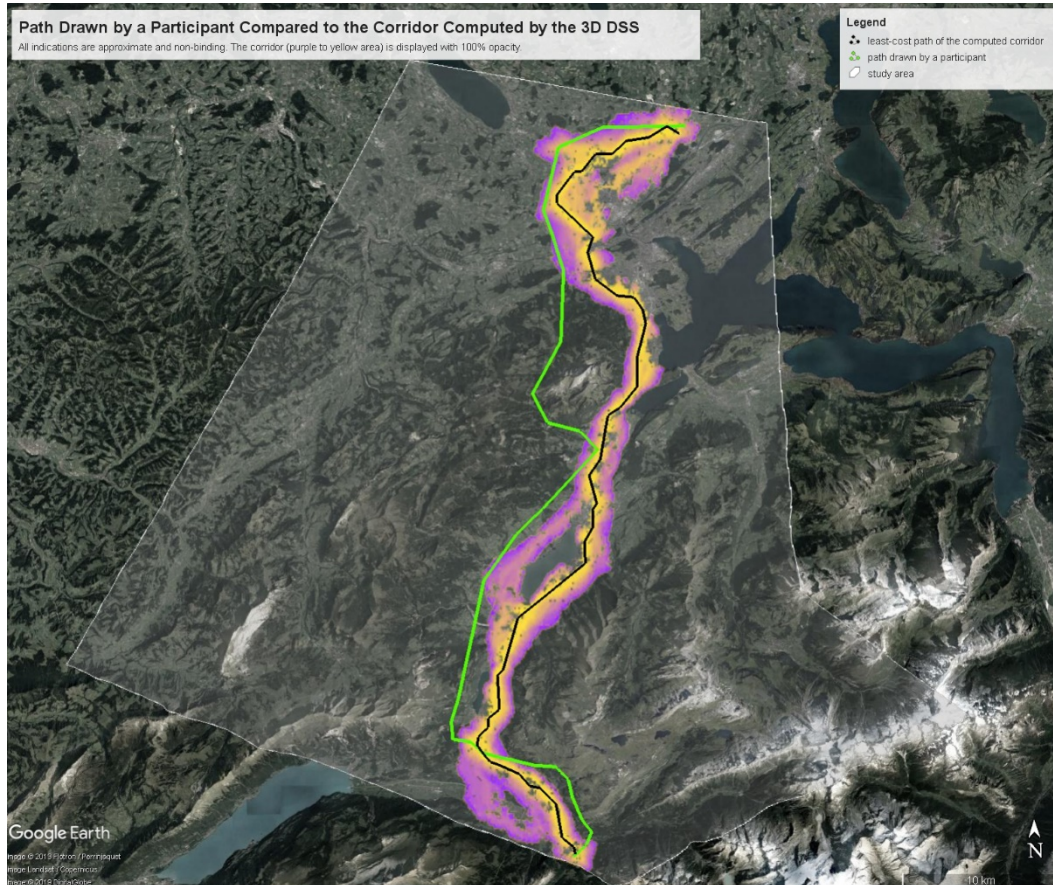

User Experience Questionnaire

# Study conducted with 10 planning experts (2019)

## Graphical outputs that support decision-making

Indicators  $\Gamma_j$  compared between participant A and the 3D DSS solution based on the scenario *Swissgrid*

# Study conducted with 10 planning experts (2019)

## Graphical outputs are helpful, however, their effect is limited

Next steps

combine overhead lines  
with earth cables

# Areas of high resistance: Where are they located?

Firmendb.de

# Main question: Where should transition structures be built?

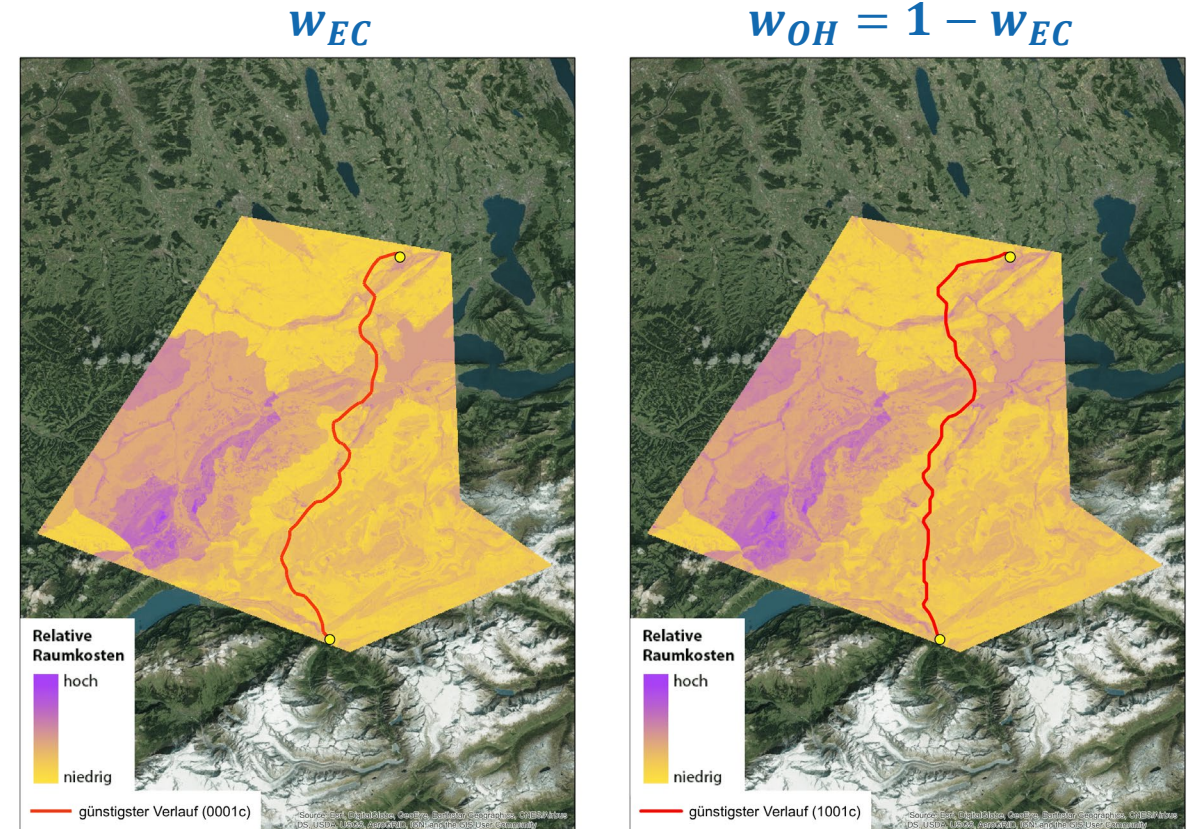

# Compute a combined corridor (earth cable + overhead line)

## Classical approach

- One decision model for computing an earth cable and one for an overhead line
- Users set the resistances for both decision models
- Two cost surfaces are computed
- The cost surfaces are weighted with

$$w_{EC} + w_{OH} = 1$$

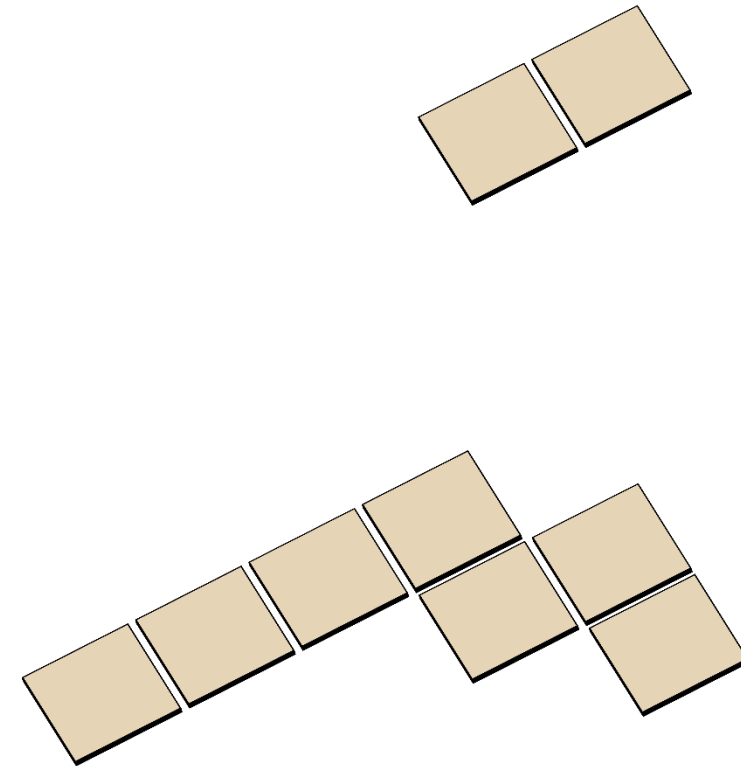

# Compute a combined corridor (earth cable + overhead line)

## Novel approach

- Determine areas of a high stress level in which an earth cable would be relieving.
- At the borders of these areas, determine appropriate places for a transition building.
- Compute the optimal earth cable path between the two transition buildings.
- Between the transition buildings and the start and end point, compute an overhead line.

allow group

decision - making

# In your opinion, which objectives are most important when planning power transmission lines?

Which objectives are most important for you?

Please enter your name

Marduk

Imagine that a new power transmission line is going to be built in an area you know well. If you could bring in your opinion, how important are the following objectives for you?

**Protect the ecosystem**

very important  important  moderately important  slightly important  not important

**Protect the landscape**

very important  important  moderately important  slightly important  not important

**Protect inhabited areas (the cultural, urban living space)**

very important  important  moderately important  slightly important  not important

**Decrease costs**

very important  important  moderately important  slightly important  not important

**Decrease risks**

very important  important  moderately important  slightly important  not important

**Increase bundling with existing infrastructures**

very important  important  moderately important  slightly important  not important

**Ensure implementability**

very important  important  moderately important  slightly important  not important

Submit

- Please, fill out the form on

**survey.joramschito.ch**

- A similar approach allows considering other aggregation models, as e.g., PROMETHEE or the Analytical Hierarchy Process.
- This might require different elicitation methods.

The screenshot displays the 3DDSS (3d decision support system) interface. The top menu includes 'Projekt', 'Kamera', 'Anzeigen', 'Bearbeiten', and 'Eigenschaften'. A toolbar contains icons for file operations, navigation, and data export. The main window shows a 3D terrain model with a highlighted path. A blue hand icon points to the 'Indicators' dropdown menu, and a yellow arrow points to a specific indicator on the map.

On the left, the 'Scenario' panel lists several scenarios with checkboxes and icons for 'R', 'C', and 'P':

- S1\_OL\_proEnv
- S2\_OL\_proEco
- S3\_OL\_proSoc
- S4\_OL\_Balance
- S5\_EC\_proSoc
- S6\_Mix\_proSoc
- S7\_XXX\_XXX

Below the scenarios are sections for 'Thresholded Accumulated Costs', 'Mode', and 'Categories' (Landscape and Environment Protection, Living Environment and Urban Planning, Construction and Maintenance). The bottom left shows logos for ETH zürich and PLUS.

The central focus is three radar charts comparing indicators  $F_i$  between a participant and the 3D DSS solution based on a scenario:

- S1\_OL\_proEnv:** Indicators  $F_i$  compared between participant C and the 3D DSS solution based on the scenario BNFU.a.
- S5\_EC\_proSoc:** Indicators  $F_i$  compared between participant D and the 3D DSS solution based on the scenario BNFU.o.
- S6\_Mix\_proSoc:** Indicators  $F_i$  compared between participant A and the 3D DSS solution based on the scenario BNF.

Each radar chart has 10 axes representing different indicators:  $F_1$  (Landscape and Environment Protection),  $F_2$  (Living Environment and Urban Planning),  $F_3$  (Construction and Maintenance),  $F_4$  (Energy),  $F_5$  (Water),  $F_6$  (Air Quality),  $F_7$  (Noise),  $F_8$  (Climate Change),  $F_9$  (Biodiversity), and  $F_{10}$  (Socio-Economic). The charts show the performance of the participant (dashed line) and the 3D DSS solution (solid line) across these indicators.
